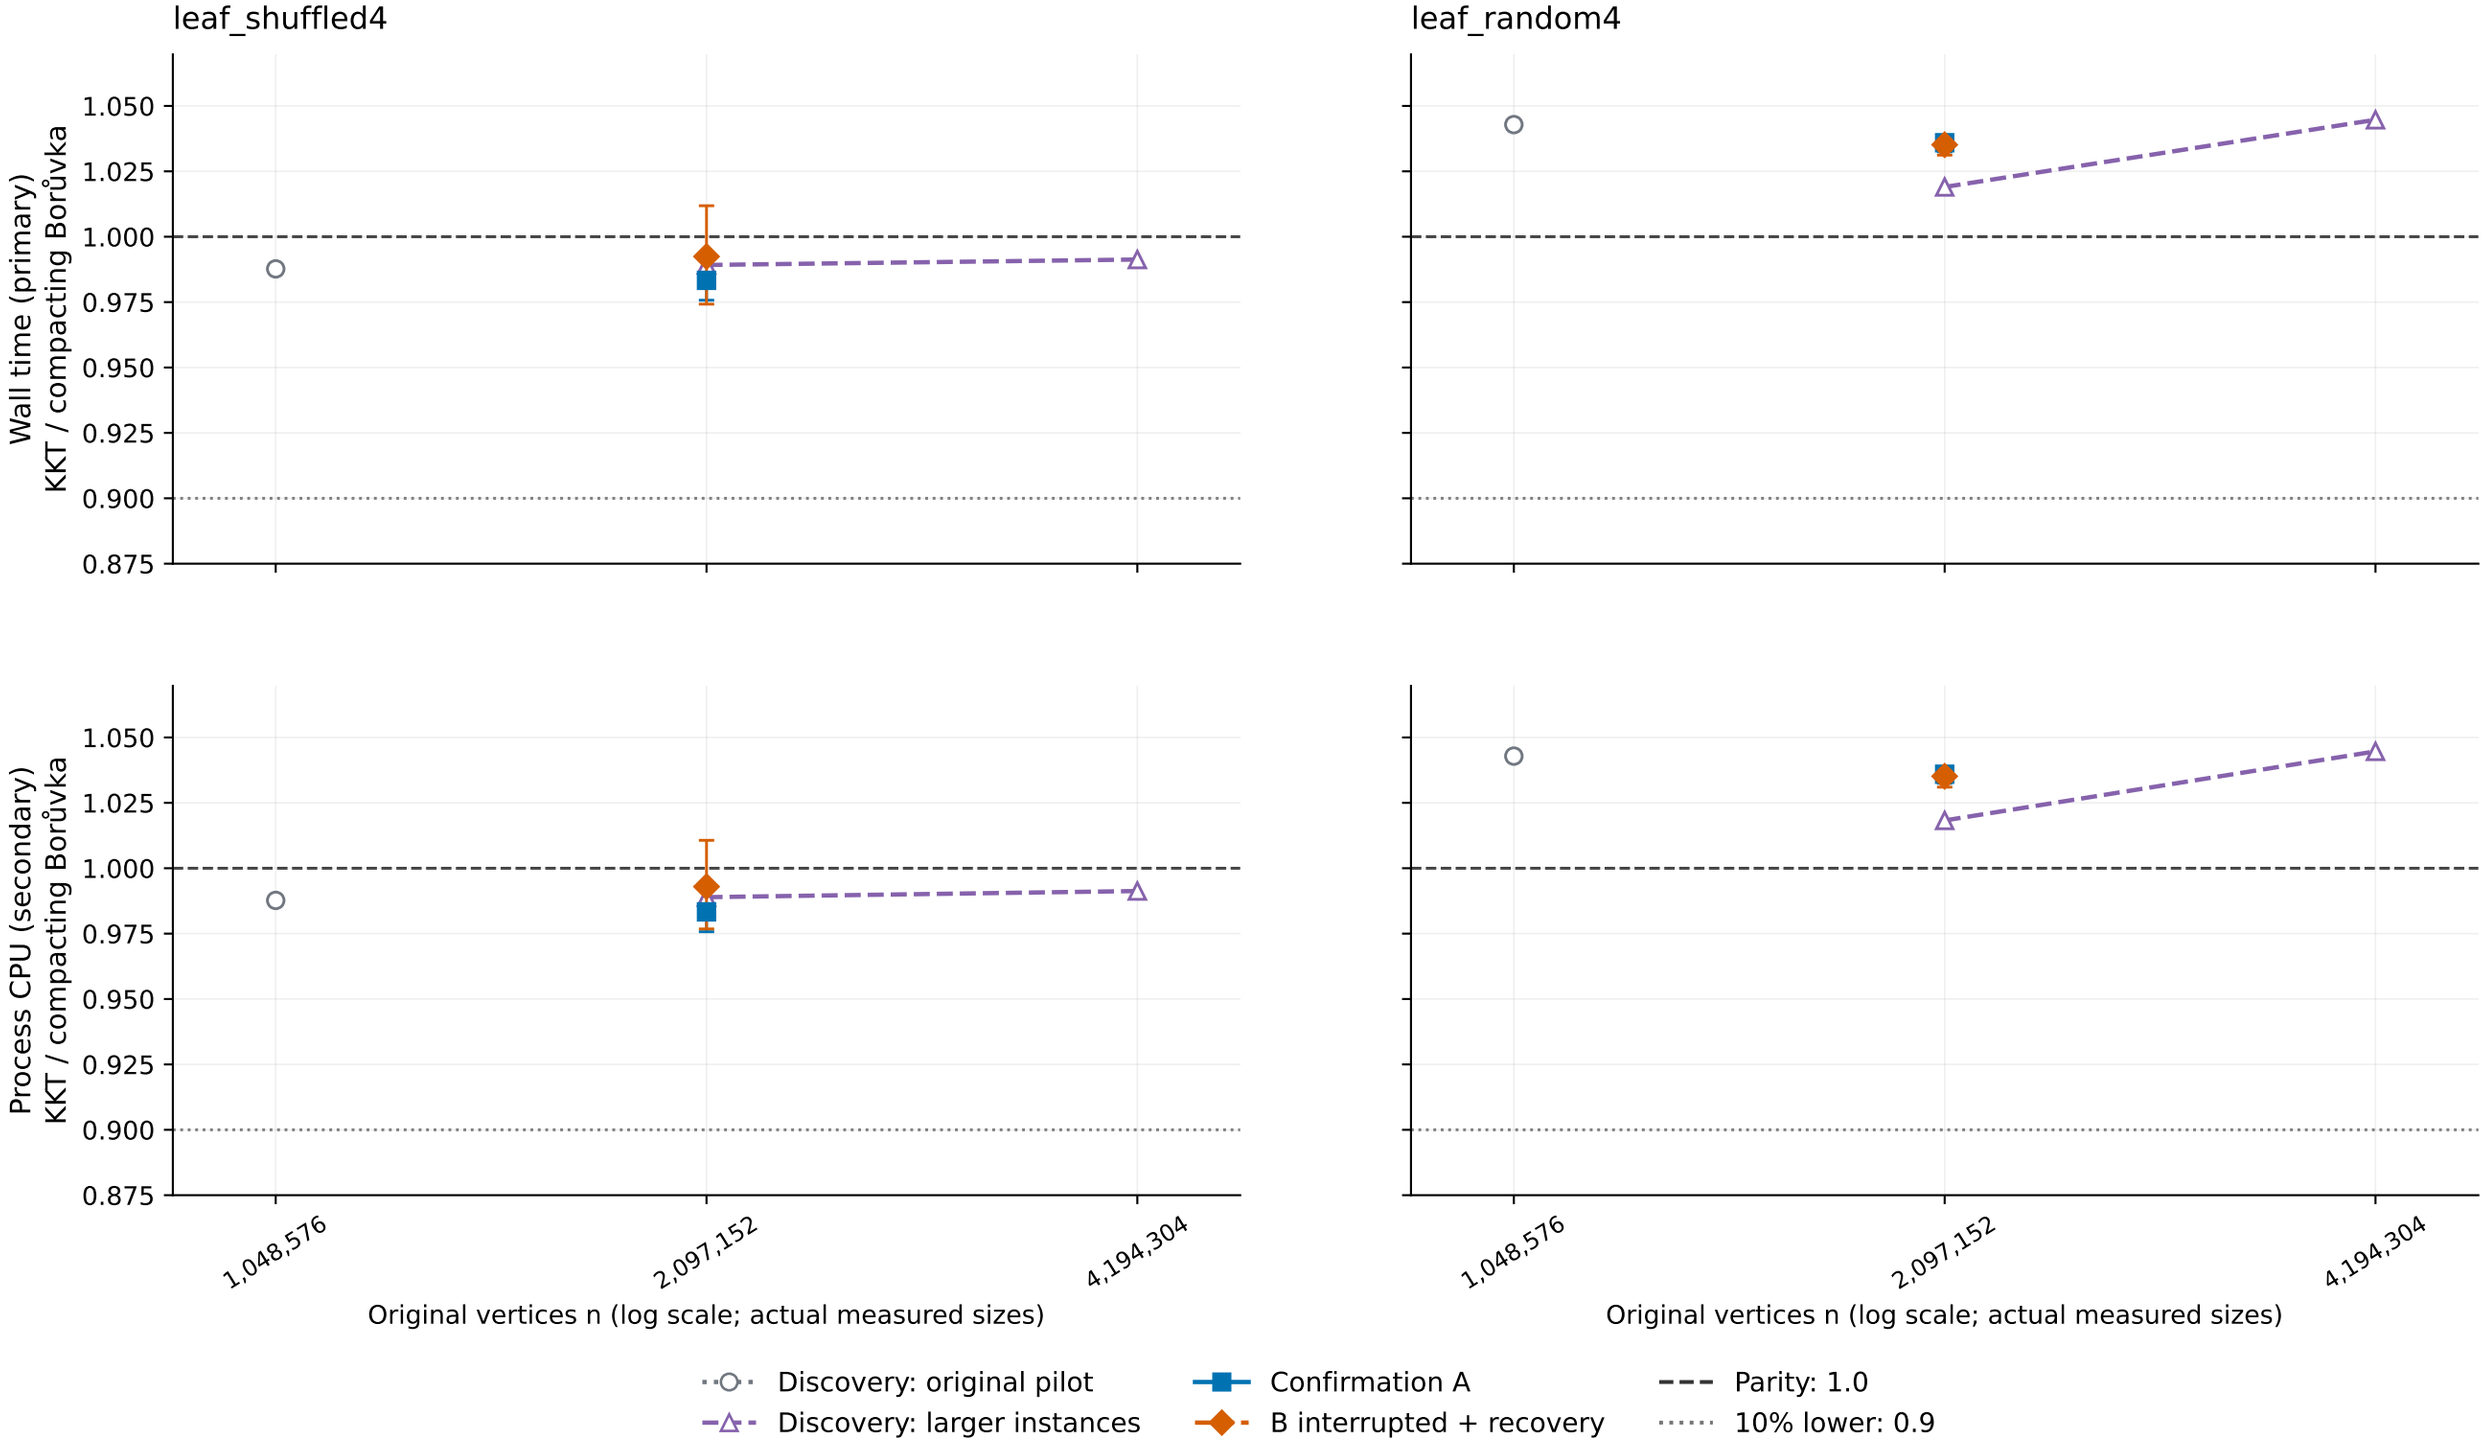
Weight controls across four separate campaigns

Shuffled core: cheap local stars preserved · global random: all weights permuted

Lower ratios favor KKT. Every line belongs to a separate capture; no observations are pooled.



A/B bars: min–max of three observed graph medians, not confidence intervals. Discovery spreads omitted here; retained in full data.

A/B reuse the same three graphs and two KKT seeds. Lines connect measured points only; no fitted crossover or extrapolation.
