Lower sampling: which recursive work shrinks, and which grows?

Ordered hierarchy · n = 65,536

Shuffled twin · n = 65,536

Random G(n,m) · n = 4,096

Ordered hierarchy · n = 1,048,576

Shuffled twin · n = 1,048,576

Random G(n,m) · n = 1,048,576

Eighth / half logical count · log scale

Median of four graph/sampler ratios
All four realization ratios
Full positive-ratio range

Two graphs × two sampler seeds per case; the four realizations share graphs. Counts include all recursive calls.
Eight fields selected before diagnostic results; all 65 remain in the tables. Zero ratios and undefined denominators are annotated, not plotted on the log axis.
These are different logical events, not CPU instructions or additive time costs. Instrumented durations are excluded.
